Hi all,

how can I check a user/password in a LDAP ?

Which LDAP? AD or other?

Actually, any.

My customer can have AD, ADAM or a Novell AD (don't know yet which one).

I was doing some test with ADAM and thought I could get the encoded password (MD5) to compare with the password provided by the user.

You can't retrieve the password of a windows account from the AD.

even the encoded one??

Willy.

thanks you willy

Rod
