Dear All,

let's say I have a web service.

I would like to authenticate users who try to access it.

I am on a winnt server so I will have to use NTLM but I don't want to use IIS settings.

Is there a way to authenticate a user using WSE 3.0 against NTLM??

All the samples I have found on the web provide a solution based on IIS.

Thanks for your answer

Rod
