I need to develop an application that runs as a service. Easy there are samples on how to do this.

I need to have a client which updates information for the service. Easy to do.

How do I notify the Service that details have been changed by the Client and the Service needs to re-read the data and update its self.

I would like this to work on a single PC but must consider that I may need the client running on several PC's with the service on a server.

I would like to send a message from the client(s) to the service and the service reload the data at a predefined times.

Regards
Jeff

Dear Jeff,

You can use any IPC mechanism such as named pipes, Remote procedure calls etc.

Since you want to consider IPC over network, I would suggest using Web Services Enhancements messaging technique (using for instance the the soap:tcp protocol).

Refer to this article on WSE:
<http://msdn2.microsoft.com/en-us/library/ms977323.aspx>

Feel free to ask any questions regarding IPC or WSE.

Moty
