Hello. I don't know how to force the closing of a blocked socket.

I have an server application that listens to a port. It works as it is very simple, but I'm not sure about how to close the socket.

I use a thread to run the socket part, so I don't block the user interface. If I close the application, and open again, the port is still in use.

I try to suspend the thread, but it doesn't work also.

How can I do that?

When you created the thread that manages the socket, did you set the `IsBackground` flag to true? If you do that, the OS will terminate your child threads when the main application closes.
