Tom,

I haven't seen it, but what is it that you are referencing that could be there?

I did a fresh install of VS 2008 B2. Then, I opened the VS command prompt and did a simple command-line compile of HelloWorld C# program.

What's happening is the script that runs when I open a VS command prompt is setting the LIB environment variable to a directory that does not exist. The script I'm referring to is:

```
%comspec% /k ""C:\Program Files\Microsoft Visual Studio 9.0\VC\vcvarsall.bat"" x86
```

Also, if it is a warning that doesn't specify a directory, but it still compiles, then perhaps it is an error with the install/project, and you can modify the project properties to not include that path.

As I said, there is no "project" to modify. The Microsoft script is setting the LIB variable to a directory that does not exist.

Re: ?? Warning using Command Line Compile ??

news:elCq0xJCIHA.5044@xxxxxxxxxxxxxxxxxxxxxxxxxxxx

I just set up VS 2008 B2 and did a simple command line compile from the VS command prompt.

I received this warning:

```
warning CS1668: Invalid search path 'C:\Program Files\Microsoft  
SDKs\Windows\v6.0A\lib' specified in 'LIB environment  
variable' -- 'The system cannot find the path specified. '
```

When I checked, sure enough, the "lib" directory is not present!. Perhaps I selected some combination of installation options that resulted in the "lib" directory not being created.

I was just wondering if anyone has seen this.
