Marc,

Here's another version

- * does 2-pass match as described
- * handles null reference-type values (string, byte[])
- * handles null Nullable<T> value-type values (int? etc)
- * handles (for entity T) class, struct and Nullable<struct>
- * caches and re-uses compiled delegates (thread-safe)

Thank you very much.

I did minor testing and committed your code.

Andrus.
