Hi all

I have a form with a treeview on it. I add 3 nodes and enable LabelEditing.

In the AfterLabelEdit event code I want to change the SelectedNode on the treeview however it doesn't always work.

If I click any node label, edit it and hit the Return/Enter key it works fine. However if I edit any node label and click say on a different node it won't work.

I know I'm probably doing something really stupid but can't figure out what, so any help would be much appreciated.

.
