    Hmm even with John Doe it dont work ;-)

Strange... I was sure that would do it. ;)

    I have learn a bit from this blog

[http://loopback.codebetter.com/blogs/peter.van.ooijen/archive/2007/03/02/TDD\\_3A00\\_Test-driving](http://loopback.codebetter.com/blogs/peter.van.ooijen/archive/2007/03/02/TDD_3A00_Test-driving)

    only it is writing in a another language.

Another language? It looks like C# to me...

    It look like i must declare Patients as a array of ThePatient, but i don't know how to do it.

You don't know how to create an array, or...?

Look at some of the example code from the page:

```
ControleerInput requestMessage = new ControleerInput();
requestMessage.Verzekerden = new AanvraagCovType[0];
object responseMessage = ci.controleer(requestMessage);
```

You need to create an array of AanvraagCovType objects, and assign that to the Verzekerden property of the ControleerInput object.

    Then finally i think/want to put the result of  
    UitDeCOVClass.controleer(Patients) in TheReturn slometing like TheReturn

Re: After import the wsdl i have lost it a bit

TheReturn=UitDeCOVClass.controleer(Patients); but also that give me some errors.

Well, "some errors" is way too unspecific to be helpful...

The example code puts the result in a variable of the type object, while you are putting it in a variable of the type RetourinfoCovType. Check the intellisense for the method to see what it actually returns.

Thanks for your help, i will give it a new try with your tips !  
also take some reading in my "Visual C# the basic" book about arrays  
object... Normally i work with Delphi, and when i import the WSDL there i  
get nice functions and procedure's but there is the difficulty to work  
with security x509 certificates.

Groetjes Rene.
