can you maybe send an example of what you want to do

but maybe this can help...

add a extra "non-html" tag before and after the part of html you need (if this is possible)

browsers will simply ignore these not-known tags

so

...htmlcode and stuff...

<pompom>

...code to find...

</pompom>

...other htmlcode and stuff...

```
dim re as new Regex(".+<pompom>(.)+</pompom>.+")
```

```
dim m as Match = re.Match(theHtmlSourceAsString)
```

```
if(m.Success) then
```

```
    dim myCode as String = m.Groups(1).Value
```

```
...
```

```
end if
```

if you have the correct structure you will have a match

this match will have one group containing the code you want to find...

(if i didn't made a regex error ;-))
