Hi Cor

It wasn't so much the e.Cancel that I was having trouble with, as the fact that the event doesn't get called.

If I could get the Validating event to fire I would be laughing.

As you suggest, I could put it all in the Close or Closing event, but then I would have to test to see which button was clicked as I don't want to validate if the Cancel button is clicked.

Do I need to set some properties in order to get the Validating event to fire?
