I did tryed that, and i was able to request a webpage or and post data to a form using the GET method (passing parameters in the url) but not able to understand how im supposed to POST data to a page, how do i define which items i want to post? the names and the value pairs?

Suposed i have <http://internet.com/forum.asp> then i want to call that page, but posting data, for example username=smoke password=blah, how im supposed to post those values if not in the url?

is there a way?

thanks for the help...
