Perhaps this is because your original post was deleted in my newsreader. I had forwarded it to myself and had to copy and paste it into a new post in the group. I must have deleted the original message.

The file (vbc.exe) is exactly where you said it would be. When I am in VB/Visual Studio, command window, the command (vbc) cannot be reached as apparently there is no path, dir commands as I assumed. How does the program set up this 'path', or to put it another way, how can I reach it in my command window?

> *When you start it in the DOS command window in this directory there should appear a kind of help how to use it.*

I navigated to the directory at the Win XP command prompt and evoked the command 'vbc' directing the output to my printer. I now have a copy of the info you referred to; it's a little xxxx make that, a lot beyond me at this point.

I'm not sure what you mean by this, if you could clarify please.

Thanks again.
