Hi,

Since I am not 100% sure of what I am doing (I never done a setup program, and there's not much easy guides you can find online, most of them are rather confusing to me ), I have created a couple of setup program Setup1 & Setup 2.

Setup1

>From bin, select .exe, and crystal report.

Setup2

>From bin, select .exe, and crystal report. and add the existing project.

Both can be installed (well maybe looks like installing) perfectly. However, when i tried to run it, but both is showing the same error message.

(the setup program also install the .net framework into the other computer. When i double click on the .exe file, it opens the .net framework installation, after the installation complete, installation for program begins, both looks successful)

1. Common Language Runtime Debugging Services :

Application has generated an exception that could not be handled.

Process id=0x95c(2396), Thread id=0xa9c(2716)

Click OK to terminate the application. Click CANCEL to debug the application.

[i:74b38ec9ce](When I press OK, application is terminated, but when I press CANCEL another error message popped out.)[/i:74b38ec9ce]

2. No debugger found:

Registered JIT debugger is not available. An attempt to launch a JIT debugger with the following command resulted in an error code of 0x2(2). Please check computer Settings.

ERROR

microsoft.public.dotnet.languages.vb: ERROR

cordbg.exe !a 0x95c

Click Retry to have the process wait while attaching a debugger manually.

Click Cancel to abort the JIT debug request.

[i:74b38ec9ce](obviously, I pressed Cancel here.)[/i:74b38ec9ce]

And now, obviously I need help. HELP!

Thanks
