Hi friends,

I have an application using multithreads. In that application one thread writes the data in to a file. Another thread reads the data from same file. So some errors while at the time of reading. Now i want to create a files and threads at runtime to avoid these errors. How can i create multiple files and threads for reading data from that files at runtime. Is there any way? Please if u know how to create files at runtime and how threads are created to read those files. Please let me know because this is very urgent for me. Thanks in advance.

Mamatha
