Hello all!

So I get the following error when I try to update my dataset from a windows form. "Can't create a child list for field 'TableName'" This is the error I get in my application, I found this error in the KB (Article ID : 816799) The error is built by design, and the cause is from in my case deleting the table that was bound to a control. They do have a fix or a workaround by modifying a line of code. My problem is I can't find the line of code they speak of. The code is in the form, In the InitializeComponent procedure of the Windows Form Designer generated code region, locate the following statement in the Form1 code:

```
Microsoft Visual Basic .NET codeMe.Controls.AddRange(New  
System.Windows.Forms.Control() {Me.TextBox2, Me.TextBox1, Me.ListBox1})
```

If i could find this, i could modify it, and hopefully it will fix my problem. Of course, I could be totally off base, and this has nothing to do with anything that I'm doing. Which means I will post again, LOL. If somebody could take a peak at this KB, and see if this seems right, and tell me what I'm missing.

As always, TIA!

Rudy
