Sorry – I should have given a better explanation...

I have filled a DataSet with data from a SQLServer database. I have set the DataSource of the DataGrid to this dataset. When I click in one of the cells in the datagrid – I would like to get the value to a textbox.

I have used the HitTest-function in the datagrid to get the value in the cell – but the value in the first cell is highlighted, and the HitTest doesn't work on this cell. It works on all other cell except this first highlighted one.

Does you suggestion mean that the first cell will not be highlighted? If I read the xml manually – how do I know witch cell was clicked?

Maria
