Hi,

I have been asked to interface with an AIX system running a COBOL application. Not having done this before we settled on text files written to a drive to communicate between the two systems.

Firstly, does anyone know of a better (less nasty!) way of communication between COBOL and .Net over a local network.

Secondly, if we go ahead with the text file method – would the built in folder watching functions in .Net work correctly with a NFS volume shared on the AIX box?

Many thanks in advance,

Stu
