I have a stored procedure which is as follows:

Alter Procedure "uspConfig"

```
(  
@FO int,  
@Pull varchar(4)  
)  
As  
DELETE FROM tblEEConfig  
INSERT INTO tblEEConfig  
SELECT FO, Pull, Config, StartSNRange FROM tblSerialNum WHERE FO = @FO  
AND Pull = @Pull;
```

This proc will only return one record. I would like to display the Config and StartSNRange in a text box on a .net form.

After trying the .executereader method, the .parameter.add method and a few others this is the code I am trying in a button click event:

```
Dim dsResults As String  
Dim dsStartResults As String  
dsResults = daEEConfig.Fill(DsEEConfig1).ToString  
dsStartResults = daEEConfigStart.Fill(DsEEConfigStart1).ToString  
txtFileLoc.Text = txtFileLoc.Text & dsResults & "\" & dsStartResults
```

I feel that I am way off the mark with this, but as it is, I have already spent too much time trying to get this accomplished. Any suggestions, either for the proc or the .net code, would be greatly appreciated! Thanks!
