Tom,

This is a .NET newsgroup, not Access nor VB6.

To answer your question, the Namespace.Logon method allows you to specify the profile to use:

Something like (untested):

```
Dim OutApp As Outlook.Application
Dim OutNS As Outlook.NameSpace
Dim OutMail As Outlook.MailItem
```

```
Set OutApp = CreateObject("Outlook.Application")
```

```
Set OutNS = OutApp.GetNamespace("MAPI")
OutNS.Logon "My Profile"
```

```
Set OutMail = OutApp.CreateItem(olMailItem)
```

NameSpace.Logon has some optional parameters to specify password, UI, & new Session...

Hope this helps

Jay
