Hello,

In my program I am doing a lot of connections to the database one after the other and retrieving lots of records from the database. However I am getting the message below when sometimes running this program. It would appear that I have too many connections open. Is there any way that I can get around this, or increase the number of connections, or close connections after they are used.

Thanx in advance

Geri

Additional information: Timeout expired. The timeout period elapsed prior to obtaining a connection from the pool. This may have occurred because all pooled connections were in use and max pool size was reached.
