Hi,
'm gettin mad about date conversion.

Here is the point.
Got and add-in for Excel which call functions from a web service (on a remote server)

The remote server has regional settings set to "en-UK" and date to dd/MM/yyyy. (I can't change it !)

One of my function get a string as parameter and convert it to date in the following format yyyy-mm-dd.

So, Having regional settings set to "fr-ch" (date format dd.mm.yyyy), I call my function with "31/10/2003"... Works grate (with every date).

Changing regional settings to "en-US" and date to default "M/d/yyyy", the function do not recognize the date.

I tried to set CurrentThread culture to a specific one, I tried Date.Parse... I must miss somethin...

Is there a way to get back client date format during request and convert date regarding this format ?

Help Please !
