Hi,

Maybe this will help

<http://msdn.microsoft.com/library/default.asp?url=/library/en-us/cptools/html/cpgrfnativeimagegeneratorngenexe.asp>

My development machine is a P4 2.8 GHz machine with a gig of RAM. When I
compile my project and run it I can actually see the forms being drawn
field by field. It does happen quickly, about a second or a little less
however it does appear "slow". I can imagine that the speed is going to
decrease on machines older and slower than this one so I want to be
proactive about it.

Is there any trick other than just .Show()'ing a window to make it
appear faster?
