Stanley,

As Rinze suggests, executing a command on a remote computer can be a security risk. I'm not aware of the commands to execute a command on a remote computer, although I suspect there might (might) be one.

Are your computers setup for Remote Desktop? Can they be?

<http://www.microsoft.com/windowsxp/using/mobility/default.mspx>

I would consider setting them up for Remote Desktop then remote in to each machine & deploy the setup package. This at least saves you from walking to all 10 machines. Of course you may need to walk to all 10 machines first to setup Remote Desktop, however you should save time & effort on future deployments...

Hope this helps
Jay
