Is oXML an XmlDocument? Could you maybe give a little bit of the starting xml returned from oC? Probably what is happening, is you are getting data such as

```
<data>...</...>
<data>...</...>
<data>...</...>
```

and to load it into a XmlDocument, there needs to be a higher up node such as:

```
<group>
<data>...</...>
<data>...</...>
<data>...</...>
</group>
```

You add your own node to the beginning and end so that it is well formed if this is the case. A sample would greatly help here! :-) Hope this helps and have a great day!
