I can't see anything obviously wrong with that statement. Are you sure the GUID isn't being re-generated? Perhaps you could assign the SQL statement to a string variable and Debug.WriteLine() it just to be completely sure, then execute the SQL in the string.

Are you using a SQL Server database? If so you could try these:

- execute the statement that is returned by the Debug.WriteLine() in Query Analyzer. This will tell you how many records were updated. This will discount ADO.NET problems.
- run SQL Profiler to see exactly what query was executed.

Hopefully one of these will track down the problem.
