Hi All

I hope you'll forgive me for posting this here (I've also posted to ado site but with no response so far) as I'm urgently after a solution.

Can anybody help me? I'm updating a table on a database i.e. I've modified the table in a DataSet and I want to update it to the SQL database which the table originally came from. I'm using a data adaptor and the update command and it works BUT it is soooooooooo slow!!! Can anybody tell me of any techniques to speed it up?

Thanks in advance

Geoff

.
