Hi,

I have installed a VB.NET application on a Windows 2000 computer. The application writes to the hard disk under the its folder and writes to the Registry under "LocalMachine\Software".

I want to allow Windows 2000 users to run this application using their limited user accounts (i.e. Users Group). Currently they cannot run the application because writing to Registry was denied.

How do I, as Admin, change the security settings that will allow this particular application from accessing the Registry and writing to the hard disk and without giving too much privileges to these restricted users (e.g. I don't want them to install applications, etc.)?

How about writing to LocalUser instead of LocalMachine, and use their personal applicationdata folder for the data?

Tom
