Hello!

I've built a program that show some dates to users. I got a problem when users have different configured time zone machines, where:

- One machine that determined time zone the date displayed is 01/01/2006.
- In other different machine (and other configured time zone), the date displayed is 12/31/2006 19:00:00

If I redefine the time zones of these two machines to the same, the date works fine.

I think this: if the date is registered as 01/01/2006, it should be showed as 01/01/2006, independent of fix it in CultureInfo class. Or I'm wrong?

Why does this happen and how to resolve it?
