Mike,

Are you person 1001 who tries to make a kind of Office Access Solution, you change to succeed is probably the same as if you try to make a new professional Texteditor?

It leads probably to nothing, however have a search in this newsgroup for all those late binding solutions using reflection.

Just my idea, maybe it does not help, or in the other hand maybe a lot saving you a lot of time.

Cor

Hi all

I want to execute a command stored in a variable, eg I may store:

```
Form1.Show()  
or  
Form2.Show()
```

in the variable and then execute whatever is in the variable.

I read about the System.CodeDom namespace in MSDN, however I am unable to get the example given to work. Does this do what I have in mind ?

```
Dim start As New CodeEntryPointMethod()  
Dim cs1 As New CodeMethodInvokeExpression( _  
New CodeTypeReferenceExpression("System.Console"), _  
"WriteLine", _
```

Re: Trying to execute something stored in variable

```
New CodePrimitiveExpression("Hello World!") )  
start.Statements.Add(cs1)  
*****
```

Please assist
