I would expect the image to come closer to me (zoom in, scroll DOWN) when I scroll the mouse wheel towards me and zoom out when I scroll away from me (UP)

That's my "natural" feeling

This is a curious question. I'd like to know your opinion.

I am attaching a drawing resize to a mouse wheel event.

Frankly, to me was most natural that, if I mouse wheel UP, the shape gets bigger, while it gets smaller when mouse wheel DOWN.

I just noticed that Photoshop does the opposite.

Any though about the most natural way (or perhaps are both "natural") ?
