After sending off the next crash report, follow the link you get. I suspect you'll end up at a TechNet article describing the crash. This article will probably say there is a Hotfix available. Call PSS for Visual Studio and give them the TechNet article id. I had a similar problem with VB 2005 and had the hotfix (actually 2 of them) in under 30 minutes.

I'm using Version 8, learning the language and writing some code.

It seems every session, especially when programming Crystal Reports, the program stutters and sends a message off to Microsoft. Sometimes I've lost code, other times the system sets off on a build that never finishes. Very time consuming and unproductive.

I am alone in this? I like VB.NET but I'm worried about losing important stuff.
