and for the record this doesnt return consisten results

I think that we should be able to open a connection if and when we want— and leave it open if and when we want to.

You can do so very easily...

```
Dim myConnection as new SqlConnection (...)  
Dim myDataReader1 as New SqlDataReader("Select @@SPID")  
Dim myDataReader2 as New SqlDataReader("Select @@SPID")
```

they just flat out don't give the same number.
