Go search the VB and C# newsgroups for this. It has been discussed exhaustively at least twice in the last month in both groups.

VB people thing VB is easier to read and should be used instead of C#.

C# people look down on VB people because VB is easier to read and the old versions of VB made it easier to be a sloppier programmer because of loose typing and because that's how they are.

Bottom line: There's some stuff that's best in one language or the other, but it's very, very minimal. For the most part, they are very, very close. All of the .Net Framework classes work the same in both languages.

It's like picking between French and Spanish.

Robin S.
