Well i personally would have chosen a different aproach

I would have set up a dataset with the desired interface with the dataset designer , and then bind my controls to this dataset

Then you can add colors with the bound controls and save the dataset to a XML file or a binary file (smaller and faster to serialize deserialize , however you can` t add items then with notepad)

On startup of your app you could just check if the xml / binary file exists and if so desiaralize it to a dataset object and rebind it to your controls

Thank you for the idea. I think I am going to try to pursue a course of action similar to this.

.
