Please ignore our neighborhood troll (SusieDBA is one of several aliases).

I assume you've rebuilt and republished, and it still doesn't work?

You know it's only a problem with IE7? Have you looked at the deployment manifest and the IIS folder to see if there's anything wonky in there? Or tried deploying it to a file on a server (or your computer I guess) and implement it from there?

Mine works fine with IE7, but I'm sure that doesn't make you feel better, unless it's only to verify that it does work with IE7.

Hello,

My workstation has been automatically updating IE6 to IE7. When this happens I have a problem with Click Once deployment (VS2005). What happens is that I can still publish applications – which brings up IE. In IE6 this would bring up IE to the install page of the deployed app (server\...\publish.htm). Now it just brings up IE7 and hangs. It will say "connecting..." and just hangs there so I have to close down IE and I get the Debug Error message... My temp fix was to uninstall IE7 and stay with IE6. But the workstatin keeps automatically updating back to IE7. Is there a fix I can implement so that IE7 doesn't hang when I publish/deploy my apps?

Is it a setting in IE7 perhaps or a setting in Visual Studio (2005)? Or maybe there is a patch or something at msdn? Any suggestions

Re: IE7 hangs with Click Once deployment VS2005 – any fixes?

appreciated.

Thanks,
Rich
