If I use the classic replace I'll have to do it 26 times. I was hoping that the Regular Expression could do it with one search.
I just don't know how to upper case the replacement group.

in the ide`s find and replace dialog , there is the option to use Regex , although in my opinion it is a bit overkill for what you want to accomplish a simple "clasic" find and replace will probably do the job much faster and easier

also note that the dialect used in the IDE is slightly different :-(

Do you mean the IDE dialect is different from RegEx?
Doing somethings in RegEx is differsnt than doing it in the IDE?

Thanks

I want to search for Dim [a-z] and replace it with Dim [A-Z]

That is, I want to change the first character of Dim variable names to upper case.

I can't figure know to use Regular Expression to do that.

Is it possible?

Thanks

It's certainly not the Regex I'm used too. In researched for your solution, I realized things like excluding prefix/suffice matches simply give a "No Matches Found" message.

I'm curious however, why do you need to capitalize your variable names?

Thanks,

Seth Rowe
