Hi,

I have an app which has a listbox and when i double click an associated fileS, i want their paths to be added into listbox in my application.

This code works good when i try to open a "single" file with my app which works to get commandline arguments to get file paths:

```
Dim cla As String() = Environment.GetCommandLineArgs()  
If cla.Length > 1 Then  
    ListBox1.Items.Add(cla(1))  
End if
```

But this doesn't work while opening more than one files at the same time.

Assume i select 3 files with pressing CTRL + left mouse and then "open with" my application, then i want these three files' paths must be added as items into the listbox. (listbox will have 3 items, items are the paths of files)

I hope you can help.

Regards.

.
