Hi,

I am debugging a new VB.net app using INI functions from a pre compiled .NET dll.

When I come to a line calling a function in the DLL, the debugger knows where the code of the dll is and shows it when I use F8 to proceed to the next line of code.

I have copied the compiled DLL to the debug folder of the main app and used the 'reference' screen to 'point' to that dll, but it still shows me the dll code.

Can anyone tell me how to switch this off because I will be making many many classes with DLLs and I really don't want the vb.net debugger to take me constantly to already well debugged code of the compiled DLL.

Thanking you in advance

Garry
