

Abort/Dump in ClickOnce app before my code runs

I have a program which runs fine here (created in VB9). I publish it to my web site for download & install. It runs on some computers (one or two) but not others. When it does not run, it causes a reporting and submission window to pop up. It seems something is missing.

This program was converted from a VB6 original piece. Unfortunately, I started on the .NET path just a couple of weeks after getting this app going. I have "Publish"ed other apps to the web site as a test and they are OK. They were converted from .NET 2003 or 2005.

I have gotten rid of the VB.Format conversions and use just "Format" now. I thought there might be something there. No change.

I commented this line. It did not change the problem and does not cause any errors: 'Imports VB = Microsoft.VisualBasic

Just in case someone wants to see this error up close and personal, here is the path to it. As far as I know (as Norton tell me), it is virus free but...

<http://www.iliketheinternet.com/PVM1010-Companion/publish.htm>

I put a msgbox as the first statement of the startup form's load event and the msgbox never comes up. Therefore, something bad is happening before I ever get to my code.

I cannot figure out (since M\$ won't tell me) what is missing. I expect some required .dll is not being bundled and distributed by the Publish process. I included four items I found in the compile statement (graphing and something else) and that is when the program started running on some machines. It still does not run on others. All WinXP environments.

Is there anything in the dump that tells me what it is wanting? I can see it but don't know how to glean anything useful from it. Give me a IBM VM or MVS dump and I might get somewhere with it but this stuff is foreign to me.

Abort/Dump in ClickOnce app before my code runs

Error signature

Event Type: clr20r3

it says it is a system.invalidoperationexception

I have values for P1 through P7 including the program name twice and the version info twice and some other value twice (47ed5b7e) and P7:1b and P8:ca , if they are worth anything.

WHAT invalid op?

This is VERY repeatable.

Is there anything I can do to find out what the real problem is?

Mike
