Hi,

7 might be it for the regex part of it, but you'd be well advised to download the whole Boost library. The regex stuff is slightly harder to get going than the rest of the library – read the docs properly. The file you need to include is boost/regex.hpp.

I haven't set it up for ages, but there are two options; either you can build the regex lib and link against it, or you can define BOOST\_REGEX\_NO\_LIB, and include the CPPs it requires in your project. Read the documentation though.

Steve
