David, the problem is exactly that.

I'm happy with the turn back from MS to support native C++, but they **must** continue to maintain C++/CLI as a first .NET language. Now if they are dropped database support for C++/CLI, they drop XAML from C++/CLI, C++/CLI is dead just when it is gaining a good market quota.

I really cannot understand this "forward run" until... what? Force us to get back to Borland? Linux?

C++/CLI compiler is much better than C# compiler (IMHO C# compiler is a toy that "interprets" code), C++/CLI binaries are faster than C# ones, but MS is forcing us to use C# for all.

The nonsense of that reach until use a tiny C# to develop microdevices (.NET Micro Framework). How many devices are using .NET Micro?

Tomas wrote:

All my applications are for databases .

This is an authentic disaster.

If there is no support for databases, what we must do the companies that we developed this type of applications, look for another product, another compiler?

Tomas:

I think the party line is that you should use C# or VB.NET to develop .NET GUI code.
