Not the answer I was hoping for, but thanks for the reply!

I'm trying find a way to deploy a J# application in Internet Explorer. I could use an Applet to do this, but then I would also need the J# Browser Control on each client, which is not practical in my case. So I was hoping I could just embed my JPanel in a WinFrom, put it all in an assembly, and reference it in my html page.

I'd greatly appreciate any suggestions!
thanks
