it is with .net framework...thank you..

i was reading that in framework 1.1 (i think) the http get and http put functions are disabled by default.

what if the service i'm sending this to has this disabled? or would this not be possible?

if i run a web service and click on one of the functions available, it lists a sample soap request, http get request and http post request. what is this page called and i guess the webservice generates this automatically?

reason i ask this is because below you mention `HttpWebRequest`. what if i need to use the soap request and response? is that different?

thanks.
