About 100 labels (every second time labels (hh.mm), other are empty labels).

One space is not enough – only one digit is displayed (first digit of hour). More spaces – more digits.

Marko

I'm not sure I follow.

For me a single space just helps the chart wizard identify what it thinks are labels, series data and series names. Adding more spaces has no other effect.

How many category labels do you have?

Cheers
Andy

Marko Pinteric wrote:

I was testing that. More spaces, more numbers are displayed. For the whole time number ("hh:mm") it requires about nine spaces. Problem is that depending on other graph specifics it requires less or more spaces (from 8 to 10). Is there any more stable solution?

Marko.

Andy Pope wrote:

Hi,

Easiest thing is to include a space in the first cell.
(" "; "13:00"; ""; "14:00")

Cheers

Dear experts!

I have a column chart. Category axis labels are either time ("hh:mm") or empty ("") cells. If first value in the label range is time, e.g. ("13:00"; ""; "14:00"; ""), everything is fine, in the opposite case, e.g. (""; "13:00"; ""; "14:00"), labels are not displayed. It seems that the chart calculate required space for labels according to the first value in the label range.

Is there any way to solve this problem, so labels will be displayed regardless of the fact if first value in label range is empty or not?

Thanks, Marko.
