Thank you again, I knew it was very simple (I think the trouble is the assignments I'm receiving are half-correct formulas with too much information that I try to work from).

So I've used your first formula for my criteria range.

Now, for the actual plotted data, I need a formulaic solution that references the named range "we" just made (because its the same size as the data I need to plot), but I need to have the chart always reference the last row before data was input (this being the most recent "week"). I know I've asked similar questions before, but now that I have the criteria range named, how do I utilize that to get the last row of data?

For instance:

```
=OFFSET(NMOnTimeWeekly,1,)
```

Would go to the next row, which is week 1, well.. I'm in week 32 now, and I'd like the chart to always reference the final row without going having to go into the chart each week. Any suggestions?
