Ok, I have been working through this for the last few hours to no avail.

I have 2 columns of data, driver1 and driver2.

Column 1 (driver1) contains the following (for example)

Row1 – Not Impaired

Row2 – Impaired – Tested

Row3 – Impaired – Not Tested

Row4 – Not Impaired

Row5 – Not Impaired

Column2 (driver2) contains the following.

Row1 – Impaired – Tested

Row2 – Impaired – Tested

Row3 – Not Impaired

Row4 – Not Impaired

Row5 – Impaired – Tested

Each row represents a crash report.

I need to determine the accidents that involved impaired drivers (tested and untested).

I want to compare the specific row of column1 to column2 to determine if 1 of the 2 drivers was impaired, then count the total.

In this example my output should be 4.

Any help would be appreciated.

Thanks.
