

microsoft.public.excel.misc: open file (as variable) from macro

open file (as variable) from macro

User inputs a date etc., I add path in front of date and some other manipulation, and come up w/ the filename that I'm trying to open with a macro. Then I work on that file, print it, etc. and want to close it. Problem is, when I record the "open filename", it puts that one filename in my macro as literal, rather than the cell address. I need that to be variable. As is, even when a different date is entered by user, it still keeps opening the same file cuz it's recorded that way in the macro.
