

Copy one cell to entire column

This seemingly very simply question has me baffled. I have a column of data that I need to perform an operation, something similar to '=f2-36161'. Column F has the data in numeric format. I add a column, say Column G. Then I put into G2 the '=f2-36161' and then convert this new number to a date formatted 'mm/dd/ccyy'. I'd like to replicate (copy/paste) this G2 calculation and operation down through the entire Column G. [Column G is about 15000 rows deep.]

Is there an easy way to do the copy/paste or replicate without copying G2 and then copy/paste MANUALLY down the column until I reach the end of the data?

Seems like a simply question but I can't find the 'key'.

Thanks,
Tom
