Change .SaveAs to .Save, and in your _BeforeSave procedure, wrap the .Save between lines like these:

```
Application.EnableEvents = False
' do the save here
Application.EnableEvents = True
```

Hello all, I have found some vba that may " Force users to enable macro's ". A workbook using the vba starts up and asks enable or disable macro's at startup. If you select disable, all sheets are hidden except one that says about your macro status. If you select enable, then the one about your macro status is hidden and all the other sheets are visable using the very-visable routine. This is a great idea if you wish somebody to run your file as it makes them run the file macro's and all works well – this is until you might already have a before_save routine then the file just loops and loops saying "overwrite existing file? Y/N". So my question is, when you run this file, and you enable macro's, edit some pages, then go to close, your prompt with the SaveAs routine that saves the file – but then you press the Close and then the macro hides all worksheets and displays the macro status page but because its done that again says "overwrite existing file? Y/N" – instead of this box appearing – is there a macro that can be added to the before_close routine that automatically selects "Yes" for you and does not give you the option to press No or Cancel. – If anyone would like the vba then I can add this.
