

Vlookup with nested IF

I'm working with some raw data exported to Excel from some tracking software we use. For each of our agents (call center), there are between 1-5 entries. In column A, their name will appear anywhere from 1-5 times (always consecutively) to show stats for each of the queues they may have worked on from that day. Column CQ has the number code associated with the queue. What I'm trying to do is use Vlookup to locate their name, but only return data if CQ of the same row meets a value (509) that I specify. If the value in CQ of that row does NOT meet the criteria I specify, I need it to then check the next row and the next row until it finds the row that does meet the criteria. In the advent that none of them do, I plan on simply leaving the cell blank. I'm comfortable with teh basics Vlookup and =IF, but I'm afraid that making the two work together to get this done is beyond me. Any help any of you could offer would be most appreciated.
